

SITCA offers a robust data backup solution which will automatically, (or on schedule), backup your important documents, photos, music, mail, and other files. Utilising military-grade technology, we are able to efficiently **and** reliably backup your data **and** have it available to you in case you need to restore at

any
time of day or night.

Whilst it is possible to carry out or follow a manual backup regime that requires you to copy your data on a flash drive or DVD or in other cases an external hard drive, there are certain fundamentals which are difficult for you to get away from such as:

- You have to **remember** to carry out the back-up.
- The possibility exists your backup medium may not be dependable. For example, after you have backed-up to CD/DVD you find out you cannot access any information from your CD/DVD
- Your backup gets destroyed - for example in a fire, or accidental deletion or you sat on the CD/DVD. If you are backing up your data to the same PC/Server or on the same network, you run the risk of losing that data in a fire or other acts of God (flood, hurricane, lightning strike, etc.) or other unfortunate events like theft.

Utilising SITCA's advanced backup solution, your data is stored redundantly on military-level encrypted datawarehouses on multiple hard-drives **specifically** designed to be exceptionally reliable. Some of the exceptional advanced features of SITCA's backup solution include:

- Restoring file versions up to 30 days old
- Ability to backup open **and** locked files (including Outlook .pst files)
- Ability to backup business critical servers, like Microsoft Exchange and Microsoft SQL Server
- Backup, if you so desire, to an external drive **in conjunction** with the SITCA Backup solution
